

## How do I move my sites from my old host to World Hosting Corporation?

If your old host is using cPanel you are in luck, if they aren't the only way to move your site is by uploading and downloading it all manually using a tool such as ftp.

~~Full Backups~~  
Generate/Download a Full Backup

Home Directory  
Download a home directory Backup

Download a MySQL Database Backup

Download Alias/Filter Backup

| Aliases      | Filters      |
|--------------|--------------|
| n-layers.com | n-layers.com |

Restore a Home Backup

Restore a MySQL Database

Restore an Alias/Filter

### Steps to backup and move your site

1. First login to your cpanel and click "backup" (make sure you are using x skin)
2. Once in backup click "download a home directory backup" This will backup all your email accounts, files, and a few other things. It will not backup your mysql databases.
3. If you have any mysql databases you will download them now.
4. If you have any Alias/ Filter Backups download them.
5. Congrats you have backed up your entire site, and it's now time to restore it.
6. Login to your cpanel with us click "backup"
7. Under "restore a home backup" Click "Browse" and find the home backup you have you have already downloaded, and click upload.
8. Do the same for your mysql databases.
9. Do the same for your Alias/Filters.
10. You are done with everything your site has been restored, now repeat this process for any more sites you wish to backup.

### Getting your Database to work after restoring it

After you have restored your database you will get an error when trying to view it's page.

#### Example Error:

**Warning:** mysql\_connect(): Access denied for user: 'bakerpe\_osc1@localhost' (Using password: YES) in **/home/bakerpe/public\_html/catalog/includes/functions/database.php** on line **19**  
Unable to connect to database server!

What this means is that your database now exists in cpanel, but it has no username and password assigned to it. To assign a username and password login to your cpanel and click "mysql databases" Scroll down till you see the below.

**Users:**

bakerpe\_osc1 [Delete](#)  
 bakerpe\_wbst1 [Delete](#)

Username:

Password:

Your username will look something like this yourusername\_databasename@localhost The red part would be your username. The username in our example error above is "osc1"

You will need to find out your databases password. To do so look at the error your page gave you and take notice of the path.

Path from our example error:

**`/home/bakerpe/public_html/catalog/includes/functions/database.php`**

You will now login to your sites FTP and go through the folders until you find the file listed in your error path.

You will now download the file to your computer. Once it's downloaded open it up and browse until you find your database password.

Example of what to look for: DB\_SERVER\_PASSWORD', 'nvGHdCCOdCMz');

nvGHdCCOdCMz would be our database password. We will now fill that password in for our database password, and then press "add user"

The user has now been added, but it has not been assigned to a database.

User:  Database:

Privileges

ALL  ALTER  CREATE TEMPORARY TABLES  CREATE  DELETE  DROP

SELECT  INSERT  UPDATE  REFERENCES  INDEX  LOCK TABLES

Match up the user with the database it belongs to and then just click "add user to database" You are done! If it doesn't work you messed up somewhere in these directions.
